

PROTOTYPING

We produce prototypes using pilot moulds, and if necessary we use rapid prototyping.

The pilot moulds are in effect production moulds and with this equipment we can produce as per the design with a production capacity limited to one piece at a time.

Rapid prototyping can be carried out using 3D printers, or through the use of disposable silicone moulds. In both cases the object produced can provide indications on the aesthetics and the shape of the piece.

The second technique produces a limited number of pieces, up to the complete deterioration of the equipment.
